probes: query log (question, gold ids), or
self-generated from fact-dense sentences
tuning half
hold-out half
per (level, profile) group: recompress once, then
evaluate every candidate on the tuning half:
retention ≥ ρ of best raw recall? contradictions ≤ ε?
feasible set in ascending cost
(storage, latency, tokens, noise, λ(1−retention))
confirm on hold-out:
promote as a new
policy version
fails: record it,
try the next; none
left: safest config
hold-out
confirmation
rollback() reinstates the previous promoted policy
